

EN12405

New *European standard* for volume conversion devices

It has taken many years and a variety of working committees to define a new European standard for volume conversion devices (volume correctors). And now, the results of these efforts have been published – prEN12405 has now become EN12405.

This means that, as is the case with many other products in the field of gas metering, there is now one standard describing the technical requirements for volume conversion devices.

Naturally, ELSTER's volume conversion devices EK210, EK230 and EK260 conform with this standard. At the beginning of this year, we had the 'Nederlands Meetinstituut' (NMI) check all of our volume conversion devices and the institute duly confirmed their conformity.

Now that the technical aspects of the volume conversion devices have been dealt with, all that remains is to find a standard concerning the communication interfaces. We expect news on this front very soon and we will keep you up to date on matters.
