

TECHNICAL TRAINING 2006

Success through training

The birthplace of natural gas exploitation was in Europe. In the meantime, gas has become, next to oil, the most important primary source of energy worldwide and the prospects for the future are fantastic. Enormous amounts of gas are transported all around the globe every day. Gas metering and regulating systems in all shapes and sizes provide the basis for this transportation. Elster-Instromet offers a range of high-performance and modern devices as well as technologies to ensure that the gas will continue to flow.

From 28th to 30th March, 2006, the Elster-Instromet Headquarters in Germany was the scene of an international technical training seminar, where project engineers from all over the world were given the opportunity to become familiar with the latest trends in gas technology. Experts from different specialist areas were there to pass on their know-how. The entire range of products for metering and regulating gas volume and gas characteristics was presented in detail and perspectives for future applications were brought to light.

After three days, the engineers left Germany full of new ideas. They will now be able to use the newly-acquired know-how to the benefit of international customers in their respective countries. Further training is an essential part of professional life. Even if it costs a lot of money, we must make full use of our training possibilities and keep up with progress at all times and involve as many of our partners and customers as possible.

And what's the logical consequence? The next comprehensive technical training seminar will take place again next year and we will continue to provide customers all over the world with know-how concerning the most modern systems available.
